1) Use the inbuilt dataset 'titanic' as used in the above problem. Plot a box plot for distribution of age with respect to each gender along with the information about whether they survived or not. (Column names : 'sex' and 'age')
Write observations on the inference from the above statistics.

In [1]:
```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
import warnings warnings.filterwarnings("ignore")
```

In [2]:
```
dataset = sns.load_dataset('titanic') dataset.head()
```

Out[2]:

	survived	pclass	sex	age	sibsp	parch	fare	embarked	class	who	adult_male	deck	embark_town	alive	alone
0	0	3	male	22.0	1	0	7.2500	S	Third	man	True	NaN	Southampton	no	False

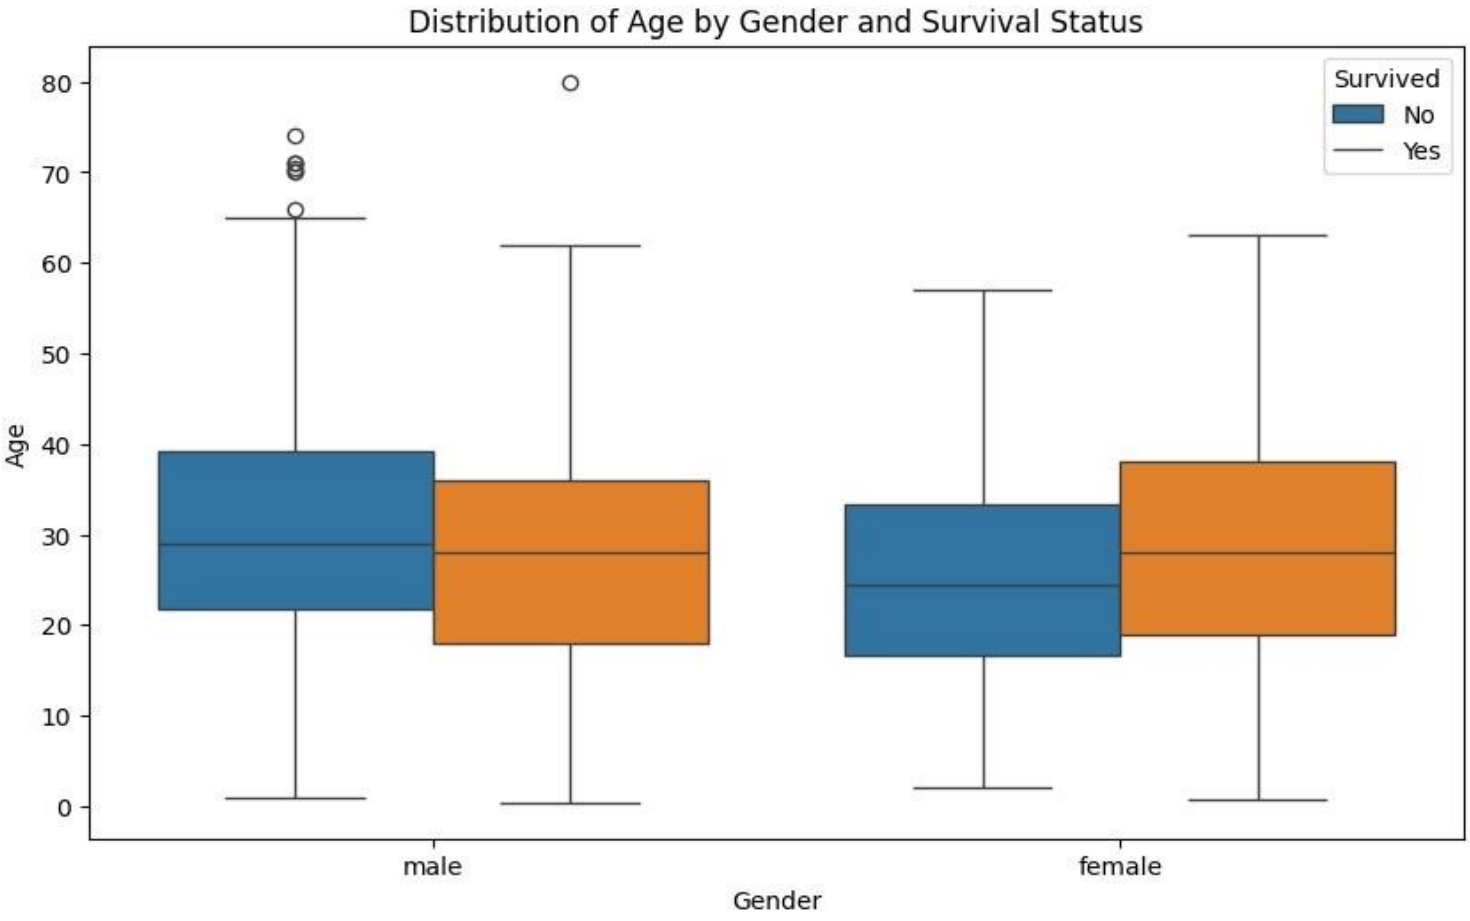
1) Use the inbuilt dataset 'titanic' as used in the above problem. Plot a box plot for distribution of age with respect to each gender along with the information about whether they survived or not. (Column names : 'sex' and 'age')

```
plt.figure(figsize=(10, 6))
sns.boxplot(x='sex', y='age', hue='survived', data=dataset) plt.title('Distribution of Age by
Gender and Survival Status') plt.xlabel('Gender')
plt.ylabel('Age')
plt.legend(title='Survived', loc='upper right', labels=['No', 'Yes']) plt.show()
```



2) **Write observations on the inference from the above statistics.**

If we want to see the box plots of forage of passengers of both genders, along with the information about whether or not they survived, we can pass the survived as value to the hue parameter.

We can also see the distribution of the passengers who survived. For instance, we can see that among the male passengers, on average more younger people survived as compared to the older ones. Similarly, we can see that the variation among the age of female passengers who did not survive is much greater than the age of the surviving female passengers.
